## 1.0 Introduction

---

This document summarizes the results of the second half 2011 (2H11) semi-annual groundwater monitoring and sampling event conducted by Stantec Consulting Corporation (Stantec; formerly SECOR International Incorporated) on behalf of Chevron Environmental Management Company (CEMC) and Atlantic Richfield Company (ARC) for the Bee-Jay Scales Site in Sunnyside, Washington (the Site).

This project is being implemented in accordance with the Washington State Department of Ecology (Ecology) Model Toxics Control Act (MTCA) and was previously implemented under Agreed Order No. DE 02TCP-3932 (Agreed Order). Per a letter from Ecology dated November 3, 2009, the substantive requirements of the Agreed Order have been completed.

The Site is located in the city of Sunnyside, within Yakima County, and is composed of two property parcels: Parcel No. 22102522014 and Parcel No. 22102522015. Parcel No. 22102522014 is located at 116 North 1<sup>st</sup> Street, and is owned by Bee-Jay Scales, Inc. Parcel No. 22102522015 is located at 301 Warehouse Avenue, and is owned by Hickenbottom & Sons, Inc. The Site location is shown on Figure 1-1. The Site layout, including monitoring well locations, building locations, and additional Site features, is shown on Figure 1-2. The Site is divided into six main study areas as follows:

- Area 1 - Liquid Fertilizer Plant and Truck Wash Area
- Area 2 - Dry Fertilizer Area
- Area 3 - Drum Storage Area
- Area 4 - Suspected Historic Washdown Area
- Area 5 - North Area
- Area 6 - Hickenbottom Property

Fieldwork for the 2H11 semi-annual groundwater monitoring and sampling at the Site was completed between September 12 and 14, 2011. A brief summary of sampling activities and results is presented in the following sections.

## **2.0 Summary of Sampling Activities**

---

Groundwater samples were collected from 11 monitoring wells this event: MW-1, MW-3, MW-4, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, and MW-13. Well MW-5 was not gauged or sampled as there was a biological hazard (wasp nest) adjacent to the well and it was not deemed safe. Monitoring well locations are shown on Figure 1-2.

### **2.1 GROUNDWATER ELEVATION MEASUREMENT**

Before sampling activities commenced, an electronic water level indicator was used to measure the depth to groundwater and total well depth from the surveyed point on the rim of each well's top of casing (TOC). Results were recorded on the Groundwater Field Log (Appendix A). Cumulative groundwater elevation data from the third quarter 2005 (3Q05) event through the 2H11 event are summarized in Table 2-1.

Groundwater contours were generated for the 2H11 groundwater monitoring event as illustrated on Figure 2-1. Depth to groundwater ranged from 6.05 feet below the TOC elevation in MW-11 to 11.75 feet below the TOC elevation in MW-1. The groundwater elevation ranged from 732.44 feet above mean sea level (MSL) at off-property well MW-13 to 736.05 feet above MSL in the southwestern portion of the Site at MW-11.

The groundwater flow direction is generally to the northeast in the northern portion of the Site (near MW-1 and MW-7) and to the southeast in the southern portion of the Site and off-property, with a groundwater flow divide observed at the southern edge of Area 5. The calculated groundwater gradient ranged from approximately 0.003 to 0.014 feet per foot, with an average hydraulic gradient of approximately 0.008 feet per foot. The lower hydraulic gradient was observed in Area 5, and the higher hydraulic gradient was observed near Area 3. This is generally consistent with the flow direction and gradient observed during the previous groundwater monitoring events.

### **2.2 SAMPLING ACTIVITIES**

Groundwater samples were collected from each of the monitoring wells using low-flow sampling procedures. During well purging, water levels and indicator field parameters were recorded on the Groundwater Sampling Field Data Sheet (Appendix A) every 3 to 5 minutes. Purging was considered complete and sampling began when indicator field parameters stabilized. Stabilization was considered to be achieved when three consecutive readings were within the following limits:

- Dissolved oxygen (DO) (10%)
- Conductivity (3%)
- Temperature (3%)
- pH ( $\pm 0.1$  unit)

**SECOND HALF 2011 SEMI-ANNUAL GROUNDWATER MONITORING AND SAMPLING  
REPORT**

Bee-Jay Scales Site, Sunnyside, Washington

- Oxidation-reduction potential (ORP) ( $\pm 10$  millivolts)

All measurements were obtained using a multi-meter with flow-through cell. Field instruments were calibrated in accordance with the manufacturer's directions prior to use. Purge volumes for each well were recorded on the Groundwater Sampling Field Data Sheet.

After collection of the samples, the pump tubing was dedicated to the well for re-sampling (by hanging the tubing inside the well) or containerized and properly disposed. Any non-dedicated sampling equipment (including water level indicator) that came into contact with the ground surface or groundwater was decontaminated between sampling points.

Purge water from the 2H11 event was collected and transferred to a 55-gallon drum that is stored on-site. Due to the low-flow sampling procedures utilized, only a small volume of purge water (generally less than 12 gallons) is generated per event. The drum will be disposed of during a future event, and disposal documentation will be included in the report at that time. In accordance with State of Washington and federal regulations, all drums will be removed from the property by a licensed waste hauler.

## 2.3 ANALYTICAL PROGRAM

Groundwater samples collected from the groundwater monitoring wells were tested for the following analytes in accordance with the protocols listed below, with the exception of well MW-5, which was not sampled during the 2H11 event as there was a biological hazard (wasp nest) adjacent to the well and it was not deemed safe. Analytical results for routine groundwater sampling are summarized in Section 3.1.1.

Well ID	Analytes (Method)	No. of Containers	Sample Container(s) (Preservative)
MW-1	Nitrate-N (EPA 353.2)	1	40 ml glass vial ( $H_2SO_4$ )
	Nitrite-N (EPA 353.2)	1	40 ml glass vial (no preservative)
MW-3	Arsenic (EPA 6010B)	1	500 ml plastic ( $HNO_3$ )
	pH (SM20 4500 H/B)	1	250 ml plastic (no preservative)
	Alkalinity (SM20 2320 B)	1	500 ml plastic (no preservative)
	Nitrate-N (EPA 353.2)	1	40 ml glass vial ( $H_2SO_4$ )
	Nitrite-N (EPA 353.2)	1	40 ml glass vial (no preservative)
	Ammonia-N (SM20 4500 NH3 D)	1	500 ml glass ( $H_2SO_4$ )
	Arsenic, Iron, Manganese (EPA 6010B)	1	500 ml plastic ( $HNO_3$ )
MW-4	pH (SM20 4500 H/B)	1	250 ml plastic (no preservative)
	Sulfate (EPA 300.0)	2	40 ml glass vial (no preservative)
	Alkalinity (SM20 2320 B)	1	500 ml plastic (no preservative)
	Nitrate-N (EPA 353.2)	1	40 ml glass vial ( $H_2SO_4$ )
	Nitrite-N (EPA 353.2)	1	40 ml glass vial (no preservative)
	Ammonia-N (SM20 4500 NH3 D)	1	500 ml glass ( $H_2SO_4$ )
	VOCs (EPA 8260B)	3	40 ml glass vials (HCl)
	Chlorinated Herbicides (EPA 8151A)	2	1000 ml glass - $Na_2S_2O_3$

	Ammonia-N (SM20 4500 NH3 D)	1	500 ml glass (H <sub>2</sub> SO <sub>4</sub> )
	Chlorinated Herbicides (EPA 8151A)	2	1000 ml glass - Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub>

\* Indicates constituents analyzed during Second Half semi-annual sampling events only.

In addition, groundwater samples were collected from wells MW-4, MW-9, MW-12, and MW-13 and submitted to ZymaX Forensics for isotope analysis in an attempt to differentiate between nitrate sources. Samples were analyzed for both nitrogen (15N/14N) and oxygen (18O/16O) isotopes. Isotope analysis results are summarized in Section 3.1.2.

## 2.4 QUALITY ASSURANCE/QUALITY CONTROL PROGRAM

The following quality assurance/quality control (QA/QC) samples were collected during the groundwater sampling activities: duplicates, equipment blanks, and trip blanks.

One duplicate sample was collected to evaluate the laboratory's performance by comparing the analytical results of two samples collected at the same location. Two equipment blanks were collected to evaluate for cross-contamination due to inadequate decontamination of sampling equipment. As volatiles were part of the analytical program, trip blanks were required and were analyzed for volatile organic compounds (VOCs) only.

QA/QC results are discussed in Section 3.2.

## 3.0 Presentation of Results

---

### 3.1 GROUNDWATER SAMPLING RESULTS

#### 3.1.1 Routine Groundwater Sampling Results

Analytical laboratory reports are included in Appendix B. Table 3-1 summarizes all detected concentrations in each groundwater sample.

Site-specific cleanup levels (CULs) for groundwater are defined in Table 2 of the *Revised Feasibility Study Report*, dated October 16, 2009, which was prepared as part of the Agreed Order. The CULs were developed from a combination of primary maximum contaminant levels (MCLs), standard MTCA Method A CULs, and standard and modified MTCA Method B CULs. Primary MCLs are set as the CUL for constituents for which they have been developed. If no MCL has been established, modified MTCA Method B CULs are generally used. In cases where modified MTCA Method B CULs have not been developed (TPH-Gx and manganese), standard MTCA Method A or Method B CULs are used.

The groundwater analytical data were compared to the site-specific CULs for applicable constituents. Concentrations of detected constituents exceeding or equal to CULs are shown at each well location on Figure 3-1. Also shown on this figure are the constituent concentrations measured at each well location during the three previous semi-annual groundwater sampling events. Concentrations of nitrate are shown at all wells on Figure 3-1, though nitrate concentrations at some wells are below the CUL.

The following is a summary of detected constituents that exceeded CULs during the 2H11 groundwater sampling event:

- Nitrate concentrations ranging from 10 milligrams per liter (mg/l) at MW-3 to 790 mg/l at MW-12 were detected in groundwater samples from six wells (MW-3, MW-4, MW-8, MW-9, MW-12, and MW-13) equal to or above the CUL of 10 mg/l;
- Nitrite concentrations of 1.2 mg/l and 2.8 mg/l were detected in groundwater samples from wells MW-3 and MW-4, respectively, above the CUL of 1 mg/l;
- 1,2-Dichloropropane concentrations of 0.02 mg/l, 0.047 mg/l, and 1.9 mg/l were detected in the groundwater samples from MW-9, MW-4, and MW-12, respectively, above the CUL of 0.005 mg/l;
- 1,2,3-Trichloropropane concentrations of 0.02 mg/l, 0.041 mg/l, and 0.18 mg/l were detected in the groundwater samples from MW-9, MW-4, and MW-12, respectively, above the CUL of 0.00001 mg/l;

**SECOND HALF 2011 SEMI-ANNUAL GROUNDWATER MONITORING AND SAMPLING REPORT**

Bee-Jay Scales Site, Sunnyside, Washington

- Dinoseb concentrations ranging from 0.022 mg/l to 2.1 mg/l were detected in the groundwater samples from four wells (MW-4, MW-9, MW-12, and MW-13) above the CUL of 0.007 mg/l;
- A 2,4-dichlorophenoxyacetic acid (2,4-D) concentration of 0.64 mg/l was detected in the groundwater sample from MW-12 above the CUL of 0.07 mg/l;
- A benzene concentration of 0.023 mg/l was detected in the groundwater sample from MW-12 above the CUL of 0.005 mg/l;
- Arsenic concentrations ranging from 0.0202 mg/l to 0.167 mg/l were detected in the groundwater samples from five wells (MW-3, MW-6, MW-10, MW-11, and MW-12) above the CUL of 0.01 mg/l; and
- A chlorobenzene concentration of 0.3 mg/l was detected in the groundwater sample from MW-12 above the CUL of 0.1 mg/l.

Alkalinity, ammonia, chloride, pH, and sulfate were analyzed, but do not present a human health risk and no CULs are established. All detected concentrations of ammonia, chloride, and sulfate are included in Table 3-1 and on Figure 3-1.

Ammonia was detected in groundwater samples collected from MW-3, MW-4, MW-8, MW-9, and MW-12 at concentrations ranging from 2 mg/l (at MW-8) to 352 mg/l (at MW-4). Chloride was detected in the groundwater sample collected from MW-12 at a concentration of 491 mg/l. Sulfate was detected in groundwater samples collected from MW-4, MW-6, MW-8, MW-9, MW-10, MW-11, MW-12, and MW-13 at concentrations ranging from 37.8 mg/l (at MW-10) to 1,280 mg/l (at MW-12).

Alkalinity and pH were analyzed for remedial design purposes. Laboratory-measured pH values ranged from 7 (at MW-12) to 8.3 (at MW-3). When titrating for total alkalinity, there are two “equivalence points” where pH changes rapidly with small additions of acid; they are located at pH 8.3 and 4.5, and both were reported by the analytical laboratory. At pH 8.3, bicarbonate is the predominant carbonate species; at pH 4.5, all carbonate and bicarbonate ions have been converted to carbonic acid. Alkalinity to pH 8.3 was detected in well MW-3 at 4 mg/l as CaCO<sub>3</sub>. Alkalinity to pH 4.5 was detected in nine wells ranging from 218 mg/l as CaCO<sub>3</sub> (at MW-6) to 602 mg/l as CaCO<sub>3</sub> (at MW-12).

### **3.1.2 Isotope Analysis Results**

Isotope analysis results are summarized in Table 3-2, and the laboratory analytical report is included in Appendix C.

The nitrogen isotope ratio (i.e., <sup>15</sup>N/<sup>14</sup>N, also expressed as δ<sup>15</sup>N) values ranged from 2.7 parts per thousand deviation from the reference standard (‰) in well MW-13 to 6.7 ‰ in well MW-4. The oxygen isotope ratio (i.e., <sup>18</sup>O/<sup>16</sup>O, also expressed as δ<sup>18</sup>O) values ranged from 0.7 ‰ in well MW-9 to 10.0 ‰ in well MW-12.

**SECOND HALF 2011 SEMI-ANNUAL GROUNDWATER MONITORING AND SAMPLING REPORT**

Bee-Jay Scales Site, Sunnyside, Washington

Results are discussed in detail in Appendix D, and the summary of findings is included below:

- Most probable source of nitrate is through oxidation of historically discharged ammonium ( $\text{NH}_4$ )-based fertilizers;
- Isotopic composition of select samples can be accounted for through microbial mediated nitrification reactions; and
- Other sources of nitrate may exist; however, differentiating these sources was not possible given the fairly limited dataset.
- Evidence for natural denitrification was also assessed; however, there was no evidence that this process was readily occurring at the site under ambient conditions. In the event denitrification is used as a corrective action strategy, artificial or induced, denitrification through application/injection of a reducing agent should be considered.

### **3.2 QUALITY ASSURANCE/QUALITY CONTROL SAMPLE RESULTS**

One duplicate sample (MW01-091311-1 from MW-1) was collected. The relative percent difference (RPD) was evaluated using Equation 1 and results are summarized in Table 3-3.

Equation 1      
$$RPD = \left[ \frac{|S - D|}{(S + D) \div 2} \right] \times 100$$

Where:  
RPD = Relative Percent Difference  
S = First Sample Value (original)  
D = Second Sample Value (duplicate)

The average RPD was 1.18%, indicating acceptable precision by the analytical laboratory for each given method and analytical batch.

Five trip blanks (TB-1 through TB-5) and two equipment blanks (MW04-091411-2 and MW08-091311-2) were submitted for analysis. Dinoseb was detected at a concentration of 0.003 mg/l in MW04-091411-2, which is the equipment blank following sample collection at well MW-4. Methylene chloride was detected at a concentration of 0.005 mg/l in TB-4. The concentrations are low and are not expected to have an impact on sample results, but care will be taken during future sampling events to make sure proper decontamination procedures and sample handling are implemented.

## 4.0 Conclusions

---

As shown in Figure 3-1, the results of the 2H11 groundwater monitoring and sampling event are generally within historical limits and consistent with what was observed in previous sampling events. Exceptions are discussed below. General results and trends relative to all historical sampling events (discussed by area of the Site) are summarized below:

- Area 1: Concentrations of nitrate and sulfate at MW-8 were generally consistent with previous data, while ammonia was a historical low. Concentrations remained generally consistent with previous data at MW-4 for 1,2-dichloropropane, 1,2,3-trichloropropane, ammonia, nitrate, nitrite, and sulfate, while dinoseb was a historical high.
- Area 2: Concentrations of arsenic, nitrate, and sulfate at MW-6 were generally consistent with previous data. MW-5 was not sampled during the 2H11 event due to a biological hazard.
- Area 3: The concentrations of arsenic, nitrate, and sulfate at MW-10 were generally consistent with previous data, while benzene was not detected. The concentrations of arsenic, nitrate, and sulfate at MW-11 were generally consistent with previous data.
- Area 4: No monitoring wells are located in Area 4.
- Area 5: Concentrations of nitrate in the wells located in the northern portion of the property (MW-1 and MW-7) were below the nitrate CUL, indicating they are not affected by the identified nitrate source areas (Areas 1 and 6).
- Area 6: The concentrations of ammonia, arsenic, nitrate, and nitrite at MW-3 were generally consistent with previous data. Concentrations of 1,2,3-trichloropropane, 1,2-dichloropropane, 2,4-D, ammonia, arsenic, chlorobenzene, dinoseb, and nitrate were generally consistent with previous data at MW-12, while concentrations of benzene, chloride, and sulfate were historical highs.
- Off-Property: Concentrations of 1,2-dichloropropane, 1,2,3-trichloropropane, dinoseb, nitrate, and sulfate at MW-9 were generally consistent with previous data, while the ammonia concentration was a historical high. The concentrations of dinoseb and sulfate at MW-13 were historical highs, while nitrate was a historical low.

Overall, concentrations were generally consistent with previous data. A historical low for nitrate was observed off-property at well MW-13 for the second sampling event in a row. A historical low for ammonia was observed in Area 1 at well MW-8, while a historical high for ammonia was observed off-property at well MW-9. Historical highs for dinoseb were observed in Area 1 at well MW-4 and off-property at well MW-13, and historical highs for sulfate were observed in Area 6 at well MW-12 and off-property at well MW-13. Historical highs for benzene and chloride were also observed in Area 6 at well MW-12. However, it should be noted that none of the

**SECOND HALF 2011 SEMI-ANNUAL GROUNDWATER MONITORING AND SAMPLING  
REPORT**

Bee-Jay Scales Site, Sunnyside, Washington

historical highs or lows were of great significance as all changes were less than an order of magnitude.

Hydrographs were prepared for each well using groundwater elevations and concentrations for selected key constituents (those included on Figure 3-1) and are included in Appendix E. Generally, constituent concentration trends are shown to be relatively stable. Semi-annual groundwater sampling will continue at the Site to determine any further trends.

Results of the isotope analysis in wells MW-4, MW-9, MW-12, and MW-13 indicated:

- Most probable source of nitrate is through oxidation of historically discharged NH<sub>4</sub>-based fertilizers;
- Isotopic composition of select samples can be accounted for through microbial mediated nitrification reactions;
- Other sources of nitrate may exist; however, differentiating these sources was not possible given the fairly limited dataset; and
- Evidence for natural denitrification was also assessed; however, there was no evidence that this process was readily occurring at the Site under ambient conditions. In the event denitrification is used as a corrective action strategy, artificial or induced, denitrification through application/injection of a reducing agent should be considered.

The limited isotope analysis dataset could not be used to definitively differentiate between multiple, isotopically distinct, sources of nitrate.

**Notes:**

GW = groundwater

NA = not accessible

MSL = mean sea level

TOC = top of casing

<sup>1</sup> Sampling frequency was reduced from quarterly to semi-annually following the 3Q08 event.

<sup>2</sup> Depth to GW during 4Q06 taken just prior to sampling, as well was covered by a drum during gauging.

<sup>3</sup> Depth to GW during 3Q08 taken just prior to sampling, as well was covered by boxes during gauging.

<sup>4</sup> Depth to GW during 3Q08 could not be measured as well could not be opened.

<sup>5</sup> Depth to GW during 1H09 taken just prior to sampling, as well was covered by boxes during gauging.

<sup>6</sup> Depth to GW during 1H09 and 2H09 taken just prior to sampling, as well could not be opened during gauging.

<sup>7</sup> Depth to GW during 2H11 could not be measured as there was a biological hazard (wasp nest) adjacent to well.

**Notes:**

\*Results in **bold** exceed or are equal to Cleanup Levels (CULs).

MDL = method detection limit

mg/l = milligrams per liter

NA = not applicable; no CUL designated

2,4-D = 2,4-Dichlorophenoxyacetic acid

2,4,5-TP = 2-(2,4,5-Trichlorophenoxy)propanoic acid; also known as Silvex

**Table 3-2**  
**Isotope Analysis Results**  
**Bee-Jay Scales Site, Sunnyside, Washington**

Location ID	Sample ID	$\delta^{15}\text{N}$ ( $^{\circ}/_{\infty}$ )	$\delta^{18}\text{O}$ ( $^{\circ}/_{\infty}$ )
MW-04	MW04-091411-0	6.7	1.0
MW-09	MW09-091411-0	5.2	0.7
MW-12	MW12-091411-0	3.5	10.0
MW-13	MW13-091411-0	2.7	2.1

$\delta^{15}\text{N}$  = Delta nitrogen-15

$\delta^{18}\text{O}$  = Delta oxygen-18

$^{\circ}/_{\infty}$  = parts per thousand deviation from the reference standard

**Table 3-3**  
**Summary of Second Half 2011 Duplicate Relative Percent Difference**

**GROUNDWATER SAMPLING FIELD DATA SHEET**

Stantec Project No.: 213Z01072 DATE: 09-13-11 WELL NO. MW-1

FACILITY NAME: Bee Jay Scales TEMPERATURE: 60  $^{\circ}$  F or  $^{\circ}$  C

FIELD PERSONNEL: J. Dauphinais D. Hanson WEATHER: Partly Cloudy w/ 50% cloud cover

**FIELD MEASUREMENTS:**

- A. Static Water Level (SWL) below top of casing/piezometer: 11.75 FT. or IN.
- B. Thickness of Free Product, if present: — Inches
- C. Total Depth of well (TD) from top of casing/piezometer: 22.85 FT. or IN.
- D. Height of Water Column in casing (h = TD - SWL): 11.13 FT. or IN.

E. Useful approximate Purge Volumes (PV) per foot of water column for common casing sizes:

	3" Well Vols.	5" Well Vols.	
2" Diameter =	0.5 gals/ft	0.82 gals/ft	x feet of water _____ = _____ PV (Gal)
4" Diameter =	2.0 gals/ft	3.25 gals/ft	x feet of water _____ = _____ PV (Gal)
6" Diameter =	4.4 gals/ft	7.35 gals/ft	x feet of water _____ = _____ PV (Gal)

PURGING METHOD: Low Flow DURATION: 15 min/201.45

1 Min = 15 sec x 2

**OBSERVATIONS:**

0.30	Cum. PV (Gal)	Time	Turbidity	DO	ORP	pH	Temp.	Conduct.	SWL	SLW
0.02x2.78 =	0.007000	857	—	9.47	-267.3	7.06	58.03	546	12.02	0.08

—	—	—	—	—	—	—	—	—	—	—
—	—	—	—	—	—	—	—	—	—	—

TOTAL VOLUME OF WATER PURGED FROM WELL: 0.33 gallons

PURGE WATER STORED/DISPOSED OF WHERE/HOW: 55 gallon drum

SAMPLES COLLECTED: Depth to Water at time of sample collection: 12.02

Sample Number(s)	Time	Size/Number of Container(s)	Preservative
MW01-091311-0	0930	40ml /2	No preservative/H <sub>2</sub> SO <sub>4</sub>
MW01-091311-1	0936	40ml /2	H <sub>2</sub> SO <sub>4</sub> /No preservative

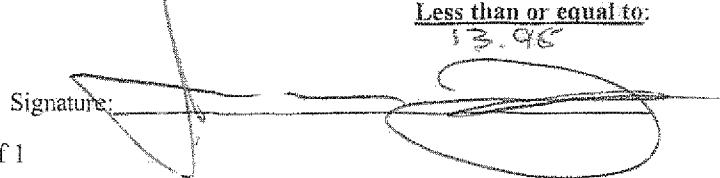

**COMMENTS:**

Duplicate taken, Screen interval for sample collect was located 16 ft down from the bottom 4 feet at the well.

Casing Capacities:  
 2-inch hole.....0.16 gal/in ft.  
 4-inch hole.....0.65 gal/in ft.  
 6.5-inch hole.....1.70 gal/in ft.  
 8-inch hole.....2.60 gal/in ft.  
 10-inch hole.....4.10 gal/in ft.

**Recharge Calculation at Time of Sample Collection:**

$$\text{Original Water Column: } 11.13 \text{ x } 0.80 = \frac{8.90}{\text{Total Depth of Well: }} \\ \text{Collect sample when Depth to Water measures} \\ \text{Less than or equal to: } 13.96$$

TOTAL VOLUME OF WATER PURGED FROM WELL: 0.33 GALLONS

PURGE WATER STORED/DISPOSED OF WHERE/HOW: 55 gallon drum

**SAMPLES COLLECTED:** Depth to Water at time of sample collection: **7.66**

Sample Number(s) MW03-091411-0 Time 0915 Size/Number of Container(s) (2) 500 ml plastic (1) 500 ml glass Preservative HNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub>, no preservative

**COMMENTS:**

WELL MAINTENANCE - ADDED MISSING BOLT to LID. Sample collected at the bottom 4 feet of well screen.

Casing Capacities:
2-inch hole.....0.16 gal/in ft.
4-inch hole.....0.65 gal/in ft.
6.5-inch hole.....1.70 gal/in ft.
8-inch hole.....2.60 gal/in ft.
10-inch hole.....4.30 gal/in ft.

#### Recharge Calculation at Time of Sample Collection:

Original Water Column: 11.70 x 0.80 = (9.36)  
 Collect sample when Depth to Water measures  
 Less than or equal to:

Signature: Melanie Dawson 9.644

**GROUNDWATER SAMPLING FIELD DATA SHEET**

Stantec Project No.: 213201072 DATE: 9/14/11 WELL NO. MW-4

FACILITY NAME: Bee-Jay Scales TEMPERATURE: 80 °F or °C

FIELD PERSONNEL: J. Dauphinais, D. Hamon WEATHER: Sunny, Hazy.

**FIELD MEASUREMENTS:**

- A. Static Water Level (SWL) below top of casing/piezometer: 8.45 FT. or IN.
- B. Thickness of Free Product, if present: — Inches
- C. Total Depth of well (TD) from top of casing/piezometer: 17.00 FT. or IN.
- D. Height of Water Column in casing ( $h = TD - SWL$ ): 8.55 FT. or IN.

E. Useful approximate Purge Volumes (PV) per foot of water column for common casing sizes:

	3 Well Vols.	5 Well Vols.	
2" Diameter =	0.5 gals/ft	0.82 gals/ft	x feet of water _____ = PV (Gal)
4" Diameter =	2.0 gals/ft	3.25 gals/ft	x feet of water _____ = PV (Gal)
6" Diameter =	4.4 gals/ft	7.35 gals/ft	x feet of water _____ = PV (Gal)

PURGING METHOD: LOW FLOW DURATION: 12 minutes

$$25/1000 = 0.025$$

**OBSERVATIONS:**

COMMENTS: None, Sample collected at bottom 4' feet of screen.

Casing Capacities:  
 2-inch hole.....0.16 gal/in ft.  
 4-inch hole.....0.63 gal/in ft.  
 6.5-inch hole.....1.70 gal/in ft.  
 8-inch hole.....2.60 gal/in ft.  
 10-inch hole.....4.10 gal/in ft.

**Recharge Calculation at Time of Sample Collection:**

Original Water Column: 12.15 x 0.80 = 9.72 Total Depth of Well:  
 Collect sample when Depth to Water measures

Less than or equal to:

8.48  
 Signature: D. Hanson

**Stantec Consulting Corporation**  
**GROUNDWATER SAMPLING FIELD DATA SHEET**

Stantec Project No.: 213201072 DATE: 9-14-11 WELL NO. MW-12

FACILITY NAME: Bee-Jay Scales TEMPERATURE: 65 °F or °C

FIELD PERSONNEL: J. Dauphinais, D. Hanson WEATHER: Pt. Cloudy

**FIELD MEASUREMENTS:**

- A. Static Water Level (SWL) below top of casing/piezometer: 8.85 FT. or IN.
- B. Thickness of Free Product, if present: — Inches
- C. Total Depth of well (TD) from top of casing/piezometer: 17.65 FT. or IN.
- D. Height of Water Column in casing ( $h = TD - SWL$ ): 8.80 FT. or IN.

- E. Useful approximate Purge Volumes (PV) per foot of water column for common casing sizes:

	3 Well Vols.	5 Well Vols.	
2" Diameter =	0.5 gals/ft	0.82 gals/ft	x feet of water _____ = PV (Gal)
4" Diameter =	2.0 gals/ft	3.25 gals/ft	x feet of water _____ = PV (Gal)
6" Diameter =	4.4 gals/ft	7.35 gals/ft	x feet of water _____ = PV (Gal)

PURGING METHOD: LOW FLOW DURATION: 12 minutes

**OBSERVATIONS:**

Cum. PV (Gal)	Time	Turbidity	DO	ORP	pH	Temp.	Conduct.	SWL	4/m
0.026	0938	--	3.49	-191.3	6.85	57.90°F	7706	9.0	0.10

### Quality Control Summary

Client Name: STANTEC International, Inc.  
 Reported: 09/26/11 at 11:25 AM

Group Number: 1266152

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

# Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

<b>RL</b>	Reporting Limit	<b>BMQL</b>	Below Minimum Quantitation Level
<b>N.D.</b>	none detected	<b>MPN</b>	Most Probable Number
<b>TNTC</b>	Too Numerous To Count	<b>CP Units</b>	cobalt-chloroplatinate units
<b>IU</b>	International Units	<b>NTU</b>	nephelometric turbidity units
<b>umhos/cm</b>	micromhos/cm	<b>ng</b>	nanogram(s)
<b>C</b>	degrees Celsius	<b>F</b>	degrees Fahrenheit
<b>meq</b>	milliequivalents	<b>lb.</b>	pound(s)
<b>g</b>	gram(s)	<b>kg</b>	kilogram(s)
<b>ug</b>	microgram(s)	<b>mg</b>	milligram(s)
<b>ml</b>	milliliter(s)	<b>l</b>	liter(s)
<b>m3</b>	cubic meter(s)	<b>ul</b>	microliter(s)
<	less than - The number following the sign is the <u>limit of quantitation</u> , the smallest amount of analyte which can be reliably determined using this specific test.		
>	greater than		
<b>J</b>	estimated value – The result is $\geq$ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).		
<b>ppm</b>	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.		
<b>ppb</b>	parts per billion		
<b>Dry weight basis</b>	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

## U.S. EPA CLP Data Qualifiers:

### Organic Qualifiers

- A** TIC is a possible aldol-condensation product
- B** Analyte was also detected in the blank
- C** Pesticide result confirmed by GC/MS
- D** Compound quantitated on a diluted sample
- E** Concentration exceeds the calibration range of the instrument
- N** Presumptive evidence of a compound (TICs only)
- P** Concentration difference between primary and confirmation columns  $>25\%$
- U** Compound was not detected
- X,Y,Z** Defined in case narrative

### Inorganic Qualifiers

- B** Value is <CRDL, but  $\geq$ IDL
- E** Estimated due to interference
- M** Duplicate injection precision not met
- N** Spike sample not within control limits
- S** Method of standard additions (MSA) used for calculation
- U** Compound was not detected
- W** Post digestion spike out of control limits
- \* Duplicate analysis not within control limits
- + Correlation coefficient for MSA  $<0.995$

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

## Quality Control Summary

Client Name: STANTEC International, Inc.  
 Reported: 09/27/11 at 04:09 PM

Group Number: 1266541

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Wendy,

I just spoke with Justin Dauphinais, and hopefully you received his notification that the 48-hr rush samples should have arrived today. Also, I believe there are two samples missing from COC 015278.

MW08-091311-0, collected on 9/13/11 at 1500  
MW08-091311-2, collected on 9/13/11 at 1505

Both should be analyzed for:

pH (SM20 4500 H/B)
Sulfate (EPA 300.0)
Alkalinity (SM20 2320 B)
Nitrate-N (EPA 353.2)
Nitrite-N (EPA 353.2)
Ammonia-N (SM20 4500 NH3 D)

Please let me know if you have any questions. I can review Acknowledgements once they're ready to make sure all samples are listed for the correct analyses.

Thanks,  
Marisa

# Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

<b>RL</b>	Reporting Limit	<b>BMQL</b>	Below Minimum Quantitation Level
<b>N.D.</b>	none detected	<b>MPN</b>	Most Probable Number
<b>TNTC</b>	Too Numerous To Count	<b>CP Units</b>	cobalt-chloroplatinate units
<b>IU</b>	International Units	<b>NTU</b>	nephelometric turbidity units
<b>umhos/cm</b>	micromhos/cm	<b>ng</b>	nanogram(s)
<b>C</b>	degrees Celsius	<b>F</b>	degrees Fahrenheit
<b>meq</b>	milliequivalents	<b>lb.</b>	pound(s)
<b>g</b>	gram(s)	<b>kg</b>	kilogram(s)
<b>ug</b>	microgram(s)	<b>mg</b>	milligram(s)
<b>ml</b>	milliliter(s)	<b>l</b>	liter(s)
<b>m3</b>	cubic meter(s)	<b>ul</b>	microliter(s)
<	less than - The number following the sign is the <u>limit of quantitation</u> , the smallest amount of analyte which can be reliably determined using this specific test.		
>	greater than		
<b>J</b>	estimated value – The result is $\geq$ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).		
<b>ppm</b>	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.		
<b>ppb</b>	parts per billion		
<b>Dry weight basis</b>	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

## U.S. EPA CLP Data Qualifiers:

### Organic Qualifiers

- A** TIC is a possible aldol-condensation product
- B** Analyte was also detected in the blank
- C** Pesticide result confirmed by GC/MS
- D** Compound quantitated on a diluted sample
- E** Concentration exceeds the calibration range of the instrument
- N** Presumptive evidence of a compound (TICs only)
- P** Concentration difference between primary and confirmation columns  $>25\%$
- U** Compound was not detected
- X,Y,Z** Defined in case narrative

### Inorganic Qualifiers

- B** Value is <CRDL, but  $\geq$ IDL
- E** Estimated due to interference
- M** Duplicate injection precision not met
- N** Spike sample not within control limits
- S** Method of standard additions (MSA) used for calculation
- U** Compound was not detected
- W** Post digestion spike out of control limits
- \* Duplicate analysis not within control limits
- + Correlation coefficient for MSA  $<0.995$

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

### **Review of Nitrate Isotope and Concentration Data**

# Memo

---

Stantec

---

To: Marisa Patterson, P.E. From: Thomas W. Butler, PG  
Okemos MI Walnut Creek, CA  
File: PN: 213201072 Date: November 3, 2011

---

**SUBJECT: REVIEW OF NITRATE ISOTOPE AND CONCENTRATION DATA, BEE-JAY SCALES SITE,  
SUNNYSIDE, WASHINGTON**

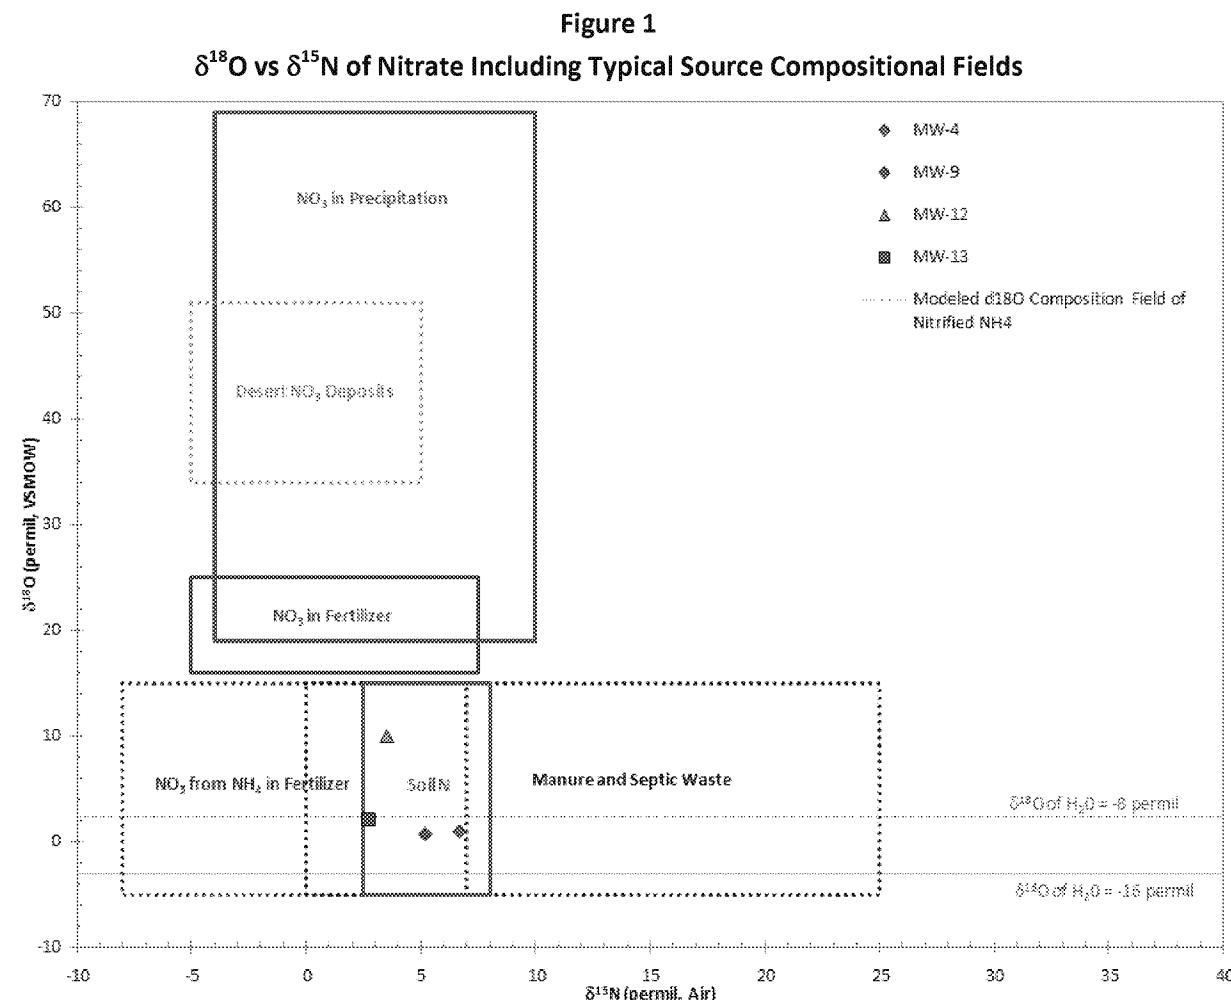

**Summary of Findings**

- Most probable source of nitrate is through oxidation of historically discharged NH<sub>4</sub>-based fertilizers;
- Isotopic composition of select samples can be accounted for through microbial mediated nitrification reactions;
- Other sources of nitrate may exist; however, differentiating these sources was not possible given the fairly limited dataset; and,
- Evidence for natural denitrification was also assessed; however, there was no evidence that this process was readily occurring at the site under ambient conditions. In the event denitrification is used as a corrective action strategy, artificial or induced, denitrification through application/injection of a reducing agent should be considered.

**Discussion**

Isotope δ<sup>18</sup>O and δ<sup>15</sup>N data for nitrate were reviewed to assess the potential sources of nitrate found in shallow groundwater near the Bee-Jay Scales site in Sunnyside, Washington. The δ<sup>18</sup>O and δ<sup>15</sup>N values of select samples were analyzed by Zymax Laboratory and reported in the conventional delta notation with the units permil, or parts per thousand deviation from the reference standard. The reference standards for δ<sup>18</sup>O and δ<sup>15</sup>N were Vienna Surface Mean Ocean Water (VSMOW) and air, respectively. These isotope data were subsequently plotted in an x-y graph (Figure 1) with typical compositional fields of various nitrate sources shown for comparison, as adapted from Kendall and McDonnell (2006)<sup>1</sup>.

Review of Figure 1 suggests an isotope composition that is consistent with nitrate derived from NH<sub>4</sub>-based fertilizer, animal waste, or natural soil nitrogen. Given the high average concentrations of nitrate observed at the select monitoring locations (ranging from approximately 140 to 800 mg/l as N), natural soil-derived nitrogen can be largely ruled out. Similarly, although manure and septic waste cannot be entirely excluded, the very high concentration of nitrate in groundwater makes a direct animal waste source less probable. Accordingly, the more likely source of nitrate observed in groundwater is through the oxidation of NH<sub>4</sub>-based fertilizer, reported to have historically been produced and stored on-site at the facility. This pathway was further evaluated as follows.

During nitrification of  $\text{NH}_4$ -based fertilizers, the  $\delta^{18}\text{O}$  of the resultant nitrate molecule has been shown to be derived from two sources, including molecular oxygen ( $\text{O}_2$ ) and the water molecule itself. Given an atmospheric oxygen  $\delta^{18}\text{O}$  value of about +23 permil (VSMOW) and estimates of groundwater  $\delta^{18}\text{O}$  values in Washington of between -8 and -16 permil (VSMOW), the  $\delta^{18}\text{O}$  of nitrate was estimated to range between approximately -3 and +2.3 permil (VSMOW). As can be seen from Figure 1, the  $\delta^{18}\text{O}$  values of nitrate for MW-4, MW-9, and MW-13 fall within this estimated range. Conversely, MW-12 plots seemingly above the expected  $\delta^{18}\text{O}$  values of microbially mediated nitrification of  $\text{NH}_4$ -based fertilizers. It is important to note that where there are large differences in the oxygen or nitrogen reservoir sizes, there are not necessarily direct linkages between oxygen and nitrogen fractionation. The only common thread is that nitrification uses oxygen from  $\text{O}_2$  and ceases to proceed when  $\text{O}_2$  is depleted<sup>1</sup>.

During microbial respiration of oxygen, the  $\delta^{18}\text{O}$  of the  $\text{O}_2$  reservoir can be significantly enriched (more positive) as the oxygen reservoir is consumed by microbes. Fractionation of oxygen isotopes through the preferential consumption of the lighter  $^{16}\text{O}$  of  $\text{O}_2$  by microbes during nitrification could reasonably account for the somewhat more positive  $\delta^{18}\text{O}$  values of nitrate observed at MW-12.

Although other sources of nitrogen could exist with similar isotopic compositions, review of these preliminary data suggest that there is no conclusive evidence of multiple, isotopically distinct, sources at the site that cannot be reasonably accounted for via variations in isotope fractionation associated with microbial nitrification processes of an NH<sub>4</sub>-fertilizer source.

Natural on-site denitrification reactions in groundwater were also assessed through review of average nitrate concentrations and δ<sup>15</sup>N values. Assessment of these data indicate that there was no direct evidence that natural denitrification is currently occurring at the select monitoring wells reviewed. Should denitrification be used as a remedial corrective action, artificial or induced, denitrification through application/injection of a reducing agent should be considered. Furthermore, if additional evidence for mixing, denitrification (natural or induced), or, other reaction pathways is required, a more comprehensive field exploration and sampling program designed to answer these questions should be developed and initiated at the site.

Sincerely,
